[Some data on the climate of an irrigated field.] Meteorologija i Gidrologija, No. 6-8-11,
1952. 2 figs., tables. DLC—Report on observations carried out by the Central Geophysical
Observatory in Kamennaja Step' (Voronezh province). These comparative observations were
made in a field one part of which was irrigated. The difference in soil temperature between
the irrigated sections and the part without irrigation reached 28°C near the soil surface; at
a depth of 5 cm it was 6-7°, and at 20 cm about 4°. Air temperatures showed greatest differ-
ences in the layer near the ground; at a height of 20 cm above the soil surface on clear days it
varied up to 9-10°C. Over the surface of vegetation the difference diminished: for 20 cm
over planted surface it was about 3°C, at 60 cm, about 1-2°C. The air humidity also was
higher over the irrigated section (at height of 20 cm the difference was 2 mb or 40-50%
relative humidity). Such peculiarities were observed during clear, sunny days. In cloudy
weather these differences were much lower. Subject Headings: 1. Soil climates 2. Plant
climate 3. Irrigation effects.—N.T.Z.

ARKHII OVA, YE. I.

"Temperature of the Soil in Forest Zones and in the Field," Tr. Gl.
Geofiz. Observ., No 44, 29-61, 1954

The author expounds data of observations during the vegetating period of three agrometeorological stations in the steppe zone during the period 1950-1952 and data of two expeditions of the Main Geophysical Observatory in 1951 (Kamenays Step') and in 1952 (Sovkhoz imeni Nansen, a state farm in Ptishchevo). Maximum influence on the temperature of the soil is exerted by the most shaded forest zones, especially in June and July. In the daytime the temperature of the soil at the surface and in the entire upper horizon (down to 20 cm) is essentially lower in comparison with exposed soil in an open field. At night the temperature of the soil at the surface rises, but in entire upper horizon it lowers in comparison with that of the field, but less significantly than in the daytime. In July in a forest-steppe zone, the daytime temperature at the surface of the soil reaches 12°, but in strongly shaded zones it is 14°; at depths of 5-10cm, the temperatures are respectively 9-6° and 12-10°. In the steppe zone the lowering is still more significant. At night the temperature of the surface of the soil in forest zones during almost all the months of the vegetating period is higher by 1-3° than that for exposed soil in an open field. Thus the temperature conditions of the soil in

"Maps of Temperature of the Surface of Exposed Soil"
Trudy Gl. geofiz. observ ., No 45, 1954, 55-59

Temperature distribution of soil surface at 1300 hours in the European Territory of the USSR from April to September is considered on the basis of data of observations by meteorological stations using mercury thermometers placed in fallow fields; here the ball of the thermometers is buried half in the soil. In the view of the small number of observation of mean quantitites over many years the author used the indirect method, which is concerned with the connection between mean monthly temperature of air at 1300 hours and temperature of soil's surface at the same time. The accuracy of the data taken from the graph amounts to plus or minus 2°. Six schematic maps are presented on which are drawn the isothermals of the mean monthly temperature of the soil's surface during the period April-September. The temperature of the surface of soil in April at 1300 hours on the average is higher than the temperature of the air in the northern regions by 4° in the southern regions by 7°. In July the change amounts to 10-15° in the northern regions and to 20-25° in the southern regions. (RZhGeol, No 9, 1955)

AUTHOR: Arkhipova, Ye.P.

TITLE: Maps of the Geographic Distribution of Storm Days on Soviet Territory (Karty geograficheskogo raspredeleniya chisla dney s grozoy na territorii SSSR)

PERIODICAL: Trudy Glavnay geofizicheskoy observatorii, 1957, Nr 74, pp 41-60 (USSR)

ABSTRACT: The purpose of this article is to assist in evolving methods for the prevention of large-scale damage caused by storms. Maps of storm days are believed to be useful tools, and thus far no maps of the monthly occurrence of storms had been made in Russia. The maps show mainly the number of storms likely to occur during the four warm months when storms are most destructive, i.e., from May to August. The diagrams included pinpoint the 86 localities where observations on the number of storm days were made. There are 5 maps and 4 Soviet references.

vystavochnyj Ministerstvo SSSR.

Ed. (title page): V.V. Orlov, Candidate of Geographical Sciences; 2d.

(inside book): L.P. Zhdanova; Tech. Ed.: A.M. Serpov.

PURPOSE: This issue of the Observatory's Transactions is intended for meteorologists, climatologists and soil scientists.

CONTENTS: The authors discuss the impact of climate and precipitation upon soil conditions and crop cultivation. Articles on snow cover in Western Europe and the problem of correlation data obtained from precipitation gauges and rain gauges are presented here as part of the International Geophysical Year Project. The article by T.A. Gol'tubars' describes a method of compiling data on probable occurrence of certain meteorological phenomena. There are numerous graphs, maps and tables. References accompany each article.

Bl. (title page); I.A. Golubkov, Doctor of Geographical Sciences;
N.I. (Inside book); V.D. Resaravskaya Tech. Ed.; N.Y. Volkov,
responsible. This book is intended for meteorologists, agronomists, workers
on collective farms, and the interested layman.

Coverage: This book provides a detailed description of the Karach'kogo
"Chernozemny" (humicolluvial) region. It lists the results of studies
made on the microclimate with the physical phenomena of the region. Individual chapters deal
with the physical phenomena underlying and shaping the microclimatic
features, and the effect the latter have upon the region's agriculture
and culture. The work was prepared by members of the Gidrometeorologicheskii
Institut. A map on the recurrence of drought was drawn up by
Doctor of Agricultural Sciences A.M. Alpat'yev and scientific worker
A.I. Porokhovskiy of the Vsesoyuznyi Nauchno-Issledovatel'skiy
Institut Klimata. Klimaticheskiye materialy were worked on by
Klimaticheskii Institut Klimata. The chart showing
the slopes of the Altai Mountains and the changes in temperature with the active
amount of precipitation during the warm period of the year was
drawn up by L.P. Kurnikova under the direction of Doctor of Geog-
raphical Sciences O.A. Dronov (GOI). There are 89 references or
notes in the book.

Chemistry of molybdenite. B. S. Christoborov, I. N.
Gvozdeva, and Z. M. Arkhipova. *Zagorsk. Geolog.*

Mineray. Obrabotka (Met. sverkhnego minerala) 183, 58-61
(1984). —For the analytical control of oxidic Mo ore beneficiation, the problem of chem. reactions of MoS_2 with dil. solns. of Na_2CO_3 and HCl is important. The concn. of the Na_2CO_3 solns. are varied between 1.5 and 3.0N at room temp., and 0°, maintained over 0.5-0 hrs. At low temp., the soln. of MoS_2 was found to be 0.10 wt. %, at 00° about 0.40 to 0.45%, in 8N HCl, at both temps., 0.37-0.41% MoS_2 as dissolved. A rational (differential phase separation) analysis of oxidic Mo ores is therefore practically not disturbed by the presence of MoS_2 . It is presumed that in the soln. exists with molybdenite an undetected trace of oxidic Mo compds. may be responsible for the rather const. amt. of 0.4% "dissolved." W. Bittel

AUTHORS: Khristoforov, B. S., Arkhipova, Z. M. SOV/54-59-1-19/25

TITLE: On the Determination of Tungsten and Iron in Tungsten Products
(Ob opredelenii vol'frama i zheleza v vol'framovykh produktakh)

PERIODICAL: Vestnik Leningradskogo universiteta. Seriya fiziki i khimii,
1959, Nr 1, pp 139-140 (USSR)

ABSTRACT. In the present paper special attention was devoted to the possibility of determining iron and tungsten simultaneously from a weighed portion. The investigation was begun by mixing solutions of sodium tungstate and iron chloride in various concentration ratios. The solutions obtained were treated with hydrochloric acid and boiled in order to obtain the precipitation of the major part of tungstic acid. By the addition of cinchonine solution, tungsten is precipitated entirely in an almost pure tungsten precipitate. The content of the iron still being in solution is then determined in the usual way by bichromate titration. The results are shown in table 1 from which may be seen that the determination of tungsten becomes less accurate in the presence of very large iron quantities. Tungsten and iron were also determined in a number of enriched products (Table 2).

Card 1/2

"On the Determination of Tungsten and Iron in Tungsten Products SOV/54-59-1-19/25

This method is stated to shorten the duration of analysis and to diminish the consumption of reagents. There are 2 tables and 1 Soviet reference.

<i>CA</i>		ARKHPOVA, Z.V.		PROCESSES AND PROPERTIES INDEX									
				Reaction between aromatic diamines and dicarboxylic acids. III. Reaction of benzidine with naphthalic anhydride. N. A. Porai-Koshits and Z. V. Arkhipova. <i>J. Gen. Chem. (U. S. S. R.)</i> 14, 843-7 (1944) (English summary); cf. <i>C.A.</i> 39, 4806. — Benzidine (M g.) was melted at 180° in a porcelain dish and treated gradually with 8 g. naphthalic anhydride (1) with agitation; after 8 min. at 170-80° the mass was cooled, boiled with HgOAc , and filtered to yield 6 g. 4-amino-4'-naphthalimidobiphenyl, m. 318° (from PhNO_2); it is insol. in the usual solvents and cannot be dissolved. The same compd. was obtained by heating equimol. amts. of the reagents in a sealed tube at 180-200°. Heating of equimol. amts. of the reagents in aq. suspension gave a small amt. of alkali-sol. product, m. 325°, which could be dissolved and which on heating to 180-75° lost this property; it is presumed to be <i>N</i> -(4'-amino-4-biphenyl)-naphthalamic acid. 4'-Nitro-4-aminobiphenyl (0.65 g.) and 0.61 g. I were refluxed for 1 hr. with 15 cc. PhNMe_2 without reaction; the same result was obtained with up to 30 hrs. heating. However, heating in the presence of water in a sealed tube to 180-200° for 8 hrs. gave a good yield of 4'-nitro-4-naphthalimidobiphenyl, m. over 300°, which does not diazonize nor is its NO_2 group susceptible to reduction by any of the methods tried. I (13.2 g.) was heated to 80° and gradually treated with 1.33 g. benzidine with the final temp. being 250°; after heating to 300° and the usual treatment, there was obtained by sublimation 4,4'-dimethylbenzidine, m. about 500°, insol. in the usual solvents. TITLE: Copolymerization of Ethylene With Propylene

PERIODICAL: Plasticheskiye massy, 1960, No. 2, pp. 4-8

TEXT: The authors deal with the copolymerization of ethylene with propylene, since polymerization of ethylene with chromium oxide catalysts on an aluminum silicate carrier results in a material of too low elasticity. The change of the polyethylene properties by increasing the ramification and reducing the degree of crystallinity by means of copolymerization of ethylene with other monomers is therefore of interest. The methods elaborated for the production of polyethylene (Ref. 1) were applied for the synthesis of ethylene copolymers with propylene. A carrier with 4% Al_2O_3 and 96% SiO_2 saturated with a 0.3 mole aqueous chromium anhydride solution was used as catalyst. The activation took place at 550°C, air velocity 200 l per 1 l catalyst during 5 hrs. A 1.5 l autoclave with a stirring

B027/B058

apparatus and steam jacket was used for the copolymerization. The degree of ramification of the copolymers was determined by infrared absorption spectra, the degree of crystallinity was calculated according to X-ray diffraction curves. The copolymerization of ethylene with propylene proceeds less readily than the polymerization of ethylene; the reaction is strongly accelerated if the pressure is increased within the range of from 8 to 30 atm. The temperature is a very important factor in the preparation of polymers with certain properties. A temperature increase reduces the viscosity, tensile strength, and breaking elongation. An increase of the propylene content in the initial mixture of the monomers leads to increased ramification of the copolymers and a reduction of the crystallinity degree. It follows from the dependence determined that the properties of new polymers can be altered toward the required direction by altering the composition of the initial mixture of the monomers and the conditions of the copolymerization process. Thanks are expressed to Professor V. M. Chulanovskiy and the scientific collaborators I. N. Andreyeva and V. M. Zapletnyak for advice rendered, to B. A. Lipkind for producing the aluminum silicate samples and to A. M. Val'berg, A. A. Stepanova, and G. S. Rubinson for experimental work. There are 6 figures,

TITLE: Determination of the solubility of polyethylene in hydrocarbons and of the dynamic viscosity of the solutions obtained

PERIODICAL: Plasticheskiye massy, no. 2, 1961, 61-65

TEXT: It was the purpose of the present paper to investigate the solubility of polyethylene in various solvents, the dependence of the solution temperature of polyethylene on its molecular weight and the concentration of the solution, as well as to measure the dynamic viscosity of the solutions obtained and their filtering velocity. The solubility of polyethylene was determined from the turbidity of a solution of given concentration during observation in transmitted light by means of the device, developed by V. N. Dyn'ko, whose schematical drawing is shown in Fig. 1. The polymer weighed portion is conveyed into the steel container 1 and, after the

Determination of the solubility...

addition of a measured quantity of solvent, the lid, which is sealed by fluoroplast, is closed. The tightness of the apparatus was checked with the gas valve closed by increasing the nitrogen pressure to 7-8 atmospheres excess pressure. From an ultrathermostat, the heat-transmitting medium is conveyed into jacket 9, the valve is partly opened, and the solvent and the polymer are mixed by means of bubbling-through N₂. The temperature was measured by means of a thermocouple, which was connected with a portable potentiometer; the measuring accuracy was $\pm 0.5^{\circ}\text{C}$. The light from lamp 10 passed quartz windows 7 and incided upon the mirror 8 from which it was reflected. The solution obtained was 20-25°C above solution temperature; when the solution was cooled, a distinct turbidity occurred, which continued to increase with dropping temperature. The temperature at which the first slight turbidity occurred was taken as solution temperature. The dynamic viscosity of the polymer solutions was measured by means of the Heller viscosimeter from formula $\mu = \tau(d_s - d_{\text{sol}}) \cdot K$, where μ is the viscosity, τ - the time of the fall of the sphere, d_s the density of the sphere, d_{sol} the

Card 2/3

Determination of the solubility...

S/191/61/000/002/011/012
B124/B204

density of the solution, and K the constant of the sphere. The measuring error is 3%. The density of polyethylene was determined in the laboratory of B. I. Sazhin. The solution temperatures of polyethylene, obtained by means of CrO_3 -catalysts, in various solvents are given in Table 1. With an increase of temperature, the solution time of polyethylene in hydrocarbons decreases, and when polyethylene concentration in the solution is changed, also the temperature of the quantitative dissolution changes (Table 2). With increasing molecular weight of polyethylene, its solution temperature increases linearly with intrinsic viscosity. The temperature dependence of the concentration of low-molecular polyethylene which remains in solution when cooled, is shown by Fig. 4, the dependence of the dynamic viscosity of the polyethylene solutions in synthol on the intrinsic viscosity is shown by Fig. 5. Professor Ye. V. Kuvshinskiy is thanked. There are 9 figures, 2 tables and 3 references: 2 Soviet-bloc and 1 non-Soviet-bloc.

TITLE: Copolymerization of ethylene with propylene using certain organometallic catalysts

SOURCE: Plasticheskiye massy, no. 10, 1965, 4-6

45
B

TOPIC TAGS: ethylene, propylene, copolymerization, catalytic polymerization, polymerization rate, copolymer, polymerization catalyst, organoaluminum compound

ABSTRACT: The relative activity of ethylene and propylene in their copolymerization using Ziegler-Natta catalysts was studied to obtain data necessary for the production of copolymers having valuable technical properties. The relative activity of propylene during copolymerization with different catalyst systems decreased in the following order: (1) $\text{Al}(\text{C}_2\text{H}_5)_2\text{Cl} + \text{TiCl}_4$; (2) $\text{Al}(\text{C}_2\text{H}_5)_3 + \text{TiCl}_4$; (3) $\text{Al}(\text{C}_2\text{H}_5)_3 + \text{VOCl}_3$; (4) $\text{Al}(\text{C}_2\text{H}_5)_2\text{Cl} + \alpha - \text{TiCl}_3$; and, (5) $\text{Al}(\text{C}_2\text{H}_5)_3 + \alpha - \text{TiCl}_3$. Change in catalyst concentration had no effect on the activity of the monomers. Change in the ratio of catalyst components in catalysts (4) and (5) did not change

Card 1/2

L 3912-66
ACCESSION NR: AP5024496

the composition of the copolymer, but decrease in the ratio of the aluminum alkyl in the other catalyst systems led to an increase in the propylene content in the copolymer made with catalysts (1) and (2), and a decrease in propylene when using catalyst (3). The copolymerization constants have the same values when catalyst systems (4) or (5) are used or when the $\text{Al}(\text{C}_6\text{H}_{13})_3 + \alpha\text{-TiCl}_3$ system is used, indicating that different aluminum alkyl derivatives in combination with $\alpha\text{-TiCl}_3$ do not change the relative activity of the monomers. The copolymerization constants change significantly with a change in the aluminum organic derivatives in systems based on TiCl_4 . This is apparently due to the different reductivity of the aluminum organic derivatives and subsequent formation of different active centers. Orig. art. has: 2 tables, 1 figure and 2 equations.

SOURCE: Plasticheskiye massy, no. 12, 1965, 6-8

TOPIC TAGS: polyethylene plastic, polymerization catalyst, aluminum compound, organoaluminum compound, intermolecular complex, ether

ABSTRACT: Polymerization of ethylene in the presence of alkyl aluminum-ether complexes as catalysts and according to the method discussed by the authors in an earlier work (Vysokomolek. soyed., 6, 444, 1964) is described. Organometallic component of the catalyst, $X(C_2H_5)_2Al \cdot O_{R''}^{R'}$ (where X = halogen) was obtained by the action of ethyl bromide, dissolved in hydrocarbon, upon the mixture of crushed aluminum-magnesium (75:25) alloy with ethers. Ethylcyclohexyl and ethylphenyl ether complexes with triethylaluminum and ethylphenyl ether complex with

TOPIC TAGS: olefin, polymerization, polymer		
ABSTRACT: An Author Certificate has been issued describing a method of obtaining polyolefins by polymerization of Alpha-olefins in a medium of an inert hydrocarbon solvent with heating in the presence of a catalyst consisting of a mixture of dialkylaluminum chloride and a heavy metal compound. To speed up the process of polymerization and expand the variety of heavy metal compounds, chelate derivatives of orthovanadic acid are suggested under the general formula $VO(OR)(OX)_2$, where R is the hydrogen or alkyl and X is the remainder of the chelating agent. Methylether of vanadium orthohydroxyquindate is the chelate derivative of orthovanadic acid suggested for use.

50th Anniversary of the Edition of the Book "Materializm i empiriokrititsizm" (50-letiye "Materializma i empiriokrititsizma"). Scientific Meeting on the Occasion of This Anniversary (Yubileynaya nauchnaya sessiya)

PERIODICAL:

Vestnik Akademii nauk SSSR, 1959, Nr 7, pp 52-57 (USSR)

ABSTRACT:

The meeting took place at the Institut filosofii Akademii nauk SSSR (Institute of Philosophy of the Academy of Sciences, USSR) on May 7th and 8th and was dedicated to the book by V. I. Lenin. Approximately 1,000 persons took part in the meeting. V. I. Lenin's philosophical ideas, developed in his book, were pointed out in the opening address by P. N. Fedoseyev, Corresponding Member, Academy of Sciences USSR. D. I. Blokhintsev, Corresponding Member, Academy of Sciences USSR, pointed out that Lenin's thesis on the inexhaustibility of the electron has proved right. Academician T. D. Lysenko emphasized that Lenin's principle on the unity of theory and practice can serve as a guidance for biologists. Academician M. B. Mitin spoke about the revolutionary spirit of ✓

S. M. Shalyutin reported on various philosophical problems of cybernetics in the light of V. I. Lenin's guiding principles. On April 24 an extended session of the Scientific Council of the Institut istorii iskusstv (Institute of the History of Art) took place which was opened by I. E. Grabar'. V. S. Kemenev spoke on "Lenin's Criticism of Machism and the Crisis of Modern Bourgeois Art". At the session of the Scientific Council of the Institut mirovoy literatury im. A. M. Gor'kogo (Institute of World Literature imeni A. M. Gor'kiy), V. R. Shcherbina reported on "Materializm i empiriokrititsizm" and on topical problems of the Soviet literary science. The 50th anniversary of the edition of this book by V. I. Lenin was also celebrated by scientific meetings of the Academies of Sciences of the Union's Republics.

TOPIC TAGS: polyacrylonitrile, diazonium salt, polymerization initiator, polymeriza-
tion rate, Chemical synthesis

ABSTRACT: The conditions of preparation of colored fiber-forming polyacrylonitrile with diazonium salts as initiators, the polymerization kinetics in the presence of the latter, and the properties of the polyacrylonitrile formed were investigated. The main factors determining the polymer yield and the required viscosity of the product were the duration of synthesis, temperature, and amount of initiator. As the latter increases, the polymerization rate is accelerated, the yield of polyacrylonitrile rises, and its viscosity decreases, owing to the presence of more free radicals formed by its decomposition. At the same time, the color of polyacrylonitrile becomes more intense. A rise in temperature speeds up the synthesis, and the

attendant decrease in yield and viscosity is apparently due to a more frequent breaking of the macromolecular chains. The optimum conditions of synthesis were determined, and the polymerization rate constants and activation energies of the synthesis of the colored polymer were obtained. The most active initiator of acrylonitrile polymerization was found to be the acetate of the diazo compound based on β -aminoanthraquinone. Orig. art. has: 2 figures and 2 tables.

SOURCE: Byulleten' izobreteniya i tovarnykh znakov, no. 17, 1965, 67

TOPIC TAGS: polymer, phosphorus, isocyanate resin, aromatic hydrocarbon

ABSTRACT: This Author's Certificate introduces a method for producing polyisocyanates
which contain phosphorus by interacting aromatic diisocyanates with trialkyl
phosphites. A wider selection of phosphorus-containing polyisocyanates is produced
by using 2,4-toluylene diisocyanate and conducting the reaction at 70-120°C.

A specialized electro-simulating ...

automatic determination of the coefficients if the curve is given experimentally as a series of discrete values. The analysis of three possible methods of constructing the curve is stated to have shown that the most adequate of them is the method of solving the system of determining differential equations. Division is replaced by taking logarithms. The elements of the computer can be used also for plotting expressions of the form ✓

$$a = A_0 e^{\pm \frac{Q_a}{RT}}, \quad (11)$$

$A = A_0 \exp(\pm at)$ and

$$B = B_0 (1 - e^{\frac{\pm a_0 t}{}}), \quad (12)$$

and for determining the area of any curve. The variation of the values of the coefficients is carried out by the method of minimizing. If the value of a coefficient is known it can be set by hand and is not searched for by the installation. There are 8 figures.

TITLE: Switching circuit, Class 42, No. 175748

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 98

TOPIC TAGS: switching circuit, sequence switch, electronic switch

ABSTRACT: This Author Certificate presents a sequence switching circuit made of four diodes with ungrounded control signal sources. To increase the response rate while decreasing the switching noise, the control signal input is connected to two full-wave rectifier circuits which are connected to variable voltage sources. The variable voltages are nearly rectangular in form and are shifted relative to each other by a quarter period by means of wide-band transformers. The transformers are connected through diode circuits to transistors which shape the switching signal.

TITLE: A special-purpose analog device with automatic search for the solution

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-1-41 s (In collection: Primeneniye vychisl. tekhn. dlya avtomatiz. proiz-v, M., Mashgiz, 1961, 427 - 435)

TEXT: The special-purpose analog device described has been designed at NIISChETMASH for the reproduction of curves described by kinetic equations of the form

$N = P_0 e^{ta_p t^B p} + M_0 (1 - e^{ta_m t^B m})$. The device is capable of solving both the direct and the inverse problem, i.e. it reproduces the curves for given values of the constant coefficients, or it determines automatically the coefficients in the equations in order to obtain a curve which is identical to another experimentally obtained.
